build a deck Report a Bug

Expanded Prompt \*

TASK: Generate code for a family travel application that allows family members to collaboratively plan and record their travel experiences. This application should focus on capturing dream destinations, past travel memories, and identifying common interests within the family to facilitate travel planning.

TECHNOLOGY STACK: Please use Python with the Flask framework for the backend and a SQLite database for data storage. Ensure compatibility with standard web browsers for the frontend. Check the existing codebase for established UI frameworks or component libraries (e.g., React, Vue.js) and utilize them to maintain consistency.

FILE STRUCTURE:

```
app.py          # Main application file with Flask routes and logic
models.py       # Data models (Family, Member, Destination) using SQLAlchemy
forms.py        # Flask-WTF forms for data input and validation
routes.py       # Defines the routes
templates/      # HTML templates
  base.html    # Base template with common elements
  index.html   # Main landing page
  member.html  # Template for individual member profiles
  destination.html # Template for destination details
static/         # Static assets (CSS, JavaScript, images)
  style.css    # Application-specific styles
  script.js    # Application-specific JavaScript
tests/          # Unit and integration tests
```

**DATA MODELS (models.py):**

```

class Family:
    family_id: int (primary key, autoincrement)
    family_name: str (e.g., "The Smiths")
    members: list of Members (one-to-many relationship)

class Member:
    member_id: int (primary key, autoincrement)
    family_id: int (foreign key to Family)
    name: str
    dream_destinations: list of Destinations (many-to-many relationship)
    visited_destinations: list of Destinations (many-to-many relationship)
    favorite_climate: str [Illustrative: "Tropical", "Temperate", "Arctic"]
    favorite_activities: str [Illustrative: "Hiking", "Museums", "Beaches"]
    energy_level: str [Illustrative: "High", "Medium", "Low"]
    travel_style: str [Illustrative: "Planner", "Wanderer"]

class Destination:
    destination_id: int (primary key, autoincrement)
    name: str
    country: str
    kid_notes: str (notes from kids about the destination)
    adult_notes: str (notes from adults about the destination)
    tags: str [Illustrative: "Food", "Nature", "Animals", "Art"]

```

**FORMS (forms.py):** Use Flask-WTF for form handling.

- MemberForm: Fields for name, favorite\_climate, favorite\_activities, energy\_level, and travel\_style.
